

Neeraj Wadhwani

Senior Software Engineer · AI & Agentic Systems

Indore, MP, India · neerajwadhwani43@gmail.com · github.com/neeraj43 · linkedin.com/in/neeraj-wadhwani · leetcode.com/u/Neeraj43

SUMMARY

Senior software engineer with 9+ years shipping and operating full-stack systems — React, Angular, Java, Node and the deployment plumbing beneath them. Now focused on agentic AI inside a regulated bank: the evaluation harnesses, guardrails and tooling that make LLM-backed features safe to ship. The hard part is rarely the prompt — it is proving a non-deterministic system is reliable, auditable and affordable before it touches anything that matters.

EXPERIENCE

Software Engineer III — JPMorgan Chase & Co. Oct 2025 – Present
Agentic AI · Developer platforms

- Building agent workflows that automate engineering tasks previously done by hand, with human-in-the-loop checkpoints at every step that touches customer or regulated data.
- Built the evaluation layer — golden datasets, regression suites and scoring — so agent changes are measured before release rather than judged by demo.
- Established guardrail patterns for prompt injection, PII handling and output validation, adopted as a baseline by other teams.
- Act as the bridge between engineers new to LLMs and the platform: reviewing designs, running enablement sessions, and turning one-off experiments into reusable internal components.

Senior Software Engineer II — Gupshup Technology Pvt Ltd, Mumbai May 2021 – Oct 2025
Conversational messaging platform at scale

- Designed and shipped scalable web components and features from ideation to production in React, Next.js and TypeScript, improving user engagement by 25%.
- Led the architectural migration from a monolith to a modular micro-frontend system using Module Federation and Storybook, enabling parallel team development and independent deployments.
- Owned the UI and API layers end to end, integrating Java microservices over REST and GraphQL, and tuned performance with lazy loading, memoisation and suspense.
- Enforced privacy and security practice across the surface: input validation, rate limiting, JWT encryption and cookie handling — backed by automated tests, CI/CD pipelines and CloudWatch monitoring.

UI Lead Engineer — Jungleworks, Chandigarh Feb 2017 – May 2021
Real-time logistics

- Led full-stack work on the Tookan dashboard for real-time logistics, delivering interactive maps and live driver tracking over WebSockets.
- Built reusable component libraries in React and Angular, improving consistency and cutting development time by 40% across features reaching 5,000+ business users.
- Mentored junior engineers, raised code-review standards, and enforced unit and integration coverage with Jest, Jasmine and Karma.

SELECTED PROJECT

Prompt Evaluator — open source · github.com/neeraj43/prompt-eval 2026

- Scores a prompt before a run is spent on it — five weighted rubrics by prompt type, plus repo-aware advice that resolves the nouns in a prompt to real file paths. The engineering problem is grade inflation: a model asked to score a prompt returns 70–85% regardless of input, so anchored levels, scoring dimensions before totals, and a committed calibration set hold the scale honest.

TECHNICAL SKILLS

AI & LLM	Agentic workflows & tool use, RAG, evaluation harnesses, guardrails & prompt-injection defence, prompt engineering, LLM observability, OpenAI & Claude APIs
Languages	TypeScript, JavaScript (ES6+), Python, Java, SQL
Frontend	React, Next.js, Angular, Web Components, Module Federation, TailwindCSS, Storybook, Jest
Backend & platform	Node.js, Java microservices, REST, GraphQL, MySQL, AWS (CloudFront, S3, Lambda, CloudWatch), Docker, CI/CD

EDUCATION

Bachelor of Technology, Computer Science — Acropolis Institute of Technology and Research 2017
